What's New In?

You might not believe it, but most of us spend at least eight hours of every day in front of a PC, tablet, or phone screen. Most of this time we spend staring at white or black for long hours on end, meaning we lack the proper eye health that comes with a vibrant color palette. That is why it is all the more important that we change the settings of our screens, otherwise we could face some serious health issues later in life. With that in mind, we mustn't forget that high contrast settings are an essential part of such a dynamic and enjoyable day, given that they provide an optimal viewing experience that also reduces eyestrain. This is where Iris comes in, as it provides you with a simple, yet effective software that you can use in order to adjust your color, brightness, and temperature of your display. How does it work? This is the most important part of Iris' functionality, as it works in a way that will automatically adjust the color of your computer screen, providing it with three types of options. The first type is automatic, meaning that it will automatically adjust the settings so they are in line with the time you have configured. Another feature comes in the form of manual, where you can make some adjustments to the color, brightness, and temperature yourself, with you having full control over the way the color looks on your screen. It's also worth mentioning that you can activate the program when you're away from your computer in order to not disturb the experience you have at home, with Iris saving your settings and allowing you to return to them when you're ready to. The last option is pausing, meaning that you can deactivate the color adjustment, with you being able to switch it back on when you return to the PC, giving you the possibility to keep your home settings. It works as a reliable way to improve your overall health The second feature the application offers is the one that allows you to configure the color of your screen, as it comes with four different types, which include health, sleep, reading, and programming. The health mode sets the settings for a place where you can enjoy a more comfortable view of the world, with the overall brightness and color temperature being more than adequate for your eyes. In the sleep mode, the brightness is significantly lowered, making it easier for you to fall asleep. The reading mode is what we would call more of a sunset tone, with the overall color being warmer but a little less so than the other two, whereas the programming mode, on the other hand, is the best way to present yourself in front of the keyboard, offering you the possibility of being more alert. Does not require you to go through a series of endless options As for the type of adjustments you will be able to make with Iris,
