

There are several types of arm meters (e.g. the 001 series), and these can be used for connection checking. If you're using a meter that has been shipped with a radio in it, it will already have the necessary equipment in it to connect to a nearby device like the radio. simply connect it to your device and turn the radio on. the data you send to the radio will be encrypted, and the meter will then send the data in the required format to the radio. if the meter is using the standard radio exchange format, it should be able to connect to the radio directly. if not, there may be a software update available from your supplier to enable this. if the meter is using a locally coded radio, the radio may require firmware updates (if it has been provided by the supplier). the radio will then need to be patched to handle the new radio codes. the radio is programmed at the factory, so no configuration is required. the radio teleswitch is a radio that connects to your meter to remotely switch your tank. switch your fuel on and off and control your domestic loads, such as heating and hot water. you can use a standard radio for most of the connection, but if the meter has been supplied with a radio with pre-programmed codes then the radio will need to be patched to handle the new codes. the radio is programmed at the factory, so no configuration is required. many radio teleswitches have the capability to control more than one load. if you have more than one load, you can have more than one meter connected to the radio, however you need to configure the radio to control each meter separately. the radio may need to be patched to handle the new codes for each meter. the radio is programmed at the factory, so no configuration is required.

Horstmann Radio Telemeter Series K Manual

You would expect them to just switch you, but as mentioned above, Horstmann doesn't offer a supported method of switch and it isn't possible for their staff to switch you without your consent. If you wish to switch, it's pretty much as simple as to hookup a radio transmitter that broadcasts a SSE send command and switch as detailed below. This isn't suitable in all cases and you'll likely need to do an in-house switch, but it's the best method I can see. To manually do a multi-meter switch to a SSE economy 7 protocol, you are going to need to have your radio transmitter be broadcasting send commands at around 1Hz. In a perfect world, you might be able to use the single click receive option on the meter to obtain a beep which you can send at 1Hz to switch to economy 7. If you get a beep though, it's not likely to work in all cases.

The third solution would be to use an oscilloscope to probe the meter and find out which of the various inputs and outputs you need to use to send SSE commands to it. This is by far the most risky method, as if your sensor is broken and you send a command to it which isn't actually intended for your meter, you risk damaging or even causing harm to the meter. You should not do this without understanding what you are doing, and only risk it when trying to find the right method to do a manual switch to an economy 7 sensor. It would be very irresponsible of me to tell you to go out and do this and I would strongly advise against it.

If there's a problem with the meter, it's probably best for you to contact the supplier or the manufacturer and try to resolve it. In a lot of cases, there's often a faulty meter or something conflicting between a meter and a radio transmitter that's causing the issue. Both suppliers and manufacturers have expert people who can have a look at your meter and see if it has any faults which would explain why it's behaving in the way it is. 5ec8ef588b
